

Volume of Commodity

Gas has the highest total trade volume among the commodities, followed by Power and Oil, with Coal having the lowest volume.

Commodity Volume Comparison

- Gas stands out as the leading commodity with the largest total trade volume, surpassing 7,000 units.
- Power is the second most traded commodity, slightly trailing Gas but ahead of Oil, reflecting robust trading activity.
- Oil occupies the third position, with a moderate total volume between Power and Coal.
- Coal consistently shows the lowest total trade volume among all commodities, indicating less trading focus or demand in this sector.

Implications

- The dominance of Gas and Power suggests market participants are most active in these sectors, likely due to higher demand, liquidity, or volatility.
- Coal's comparatively low volume may reflect shifts in market preference, environmental considerations, or less favourable trading conditions.
